

YPSILON AGENTWEB PRO

Integrated Office and Agentweb

Ypsilon has completely re-designed its Agentweb platform.

The travel agent solution not only has a new layout but also offers a myriad of new integrated functions. With the new multi windows display, agents have all relevant information and booking masks constantly visible. The time consuming process of navigating between different masks is now obsolete, the new optimize display allows agents to maximize their consulting and booking process.

Power Pricer

The innovative and proven Power Pricer module is now fully integrated into the new agent web. Agents can now easily define their service fees or mark-ups with the integrated Power pricer in order to cope with zero commission airlines.

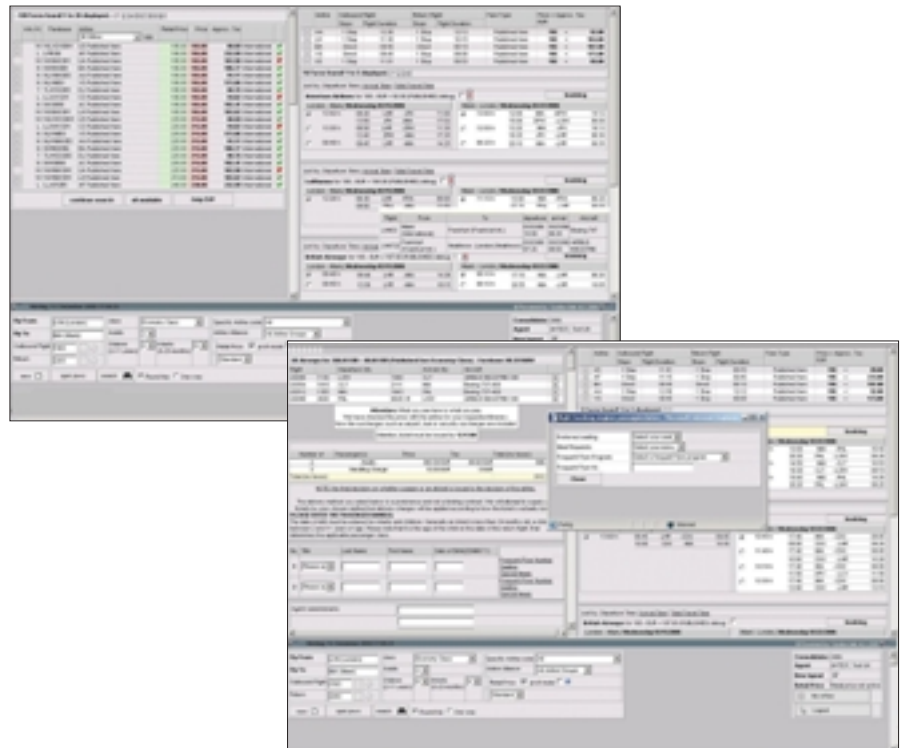

The Power Pricer offers the following options:

Definition of absolute mark-up or mark-down of all GDS loaded fares: Published, nego, unifares, corporate etc. as well as net fares and charters. It also allows dynamic service fee definition for low-cost carriers.

Mark-up can be either included in the price from the beginning or shown separately as a service fee on the final booking page.

Mark ups can be defined according to several criteria such as airline, fare type, booking class, price, route, flight number or even date.

Routings and zone can be modified or added individually, ATPCO/IATA zone definitions are pre defined in the module but can be edited.

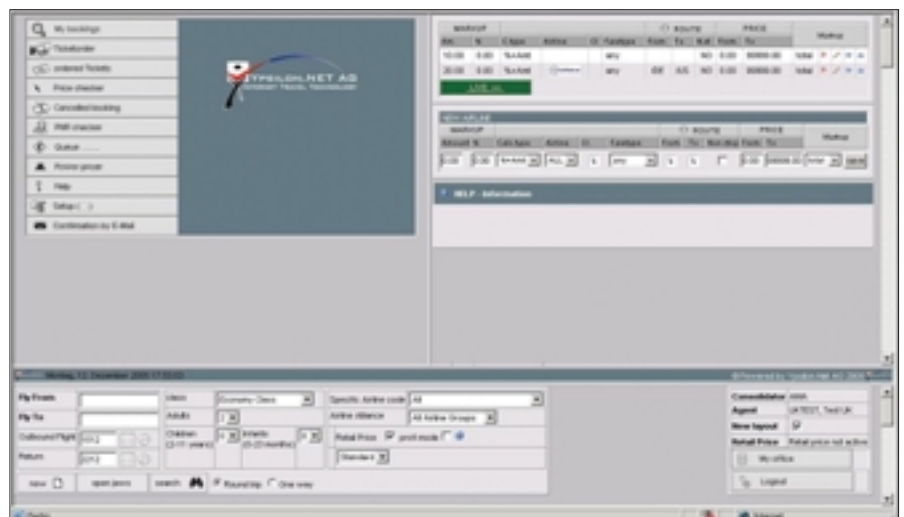

My Office

The new "My office" module enables the agent to directly access all its generated bookings.

Cancellation or queueing of bookings can also be done by the agents directly via the graphical interface,

provided that the agent has been assigned the right to do so. A simple click will cancel or queue a booking to a pre-defined ticketing queue. GDS cryptic commands are not needed.

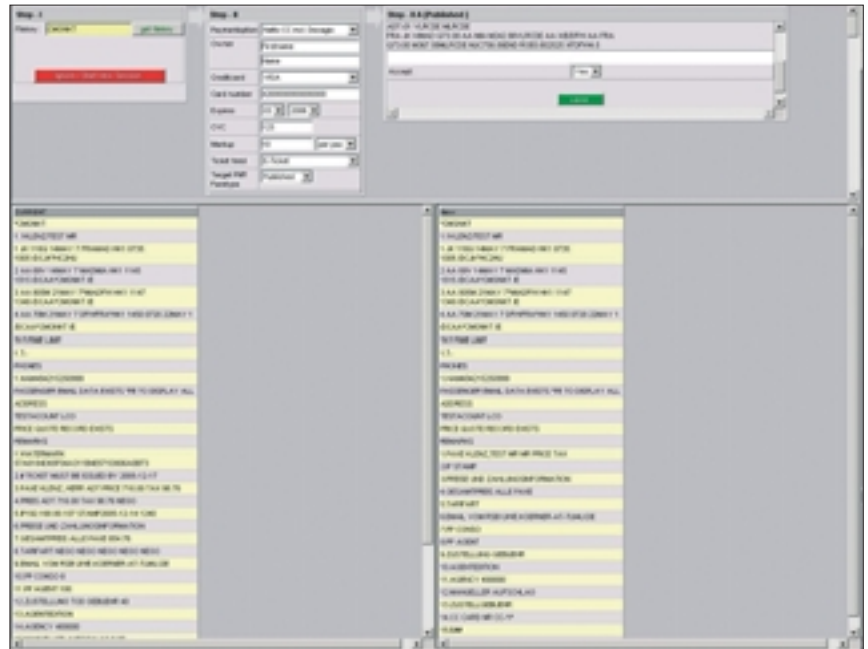

PNR Converter

The PNR converter contains 2 main functions: the PNR checker and the Price checker.

The PNR checker validates the remarks of a manually generated booking and adds or amends the remarks automatically to ensure full compatibility with the consolidator pre-defined PNR remarks structure.

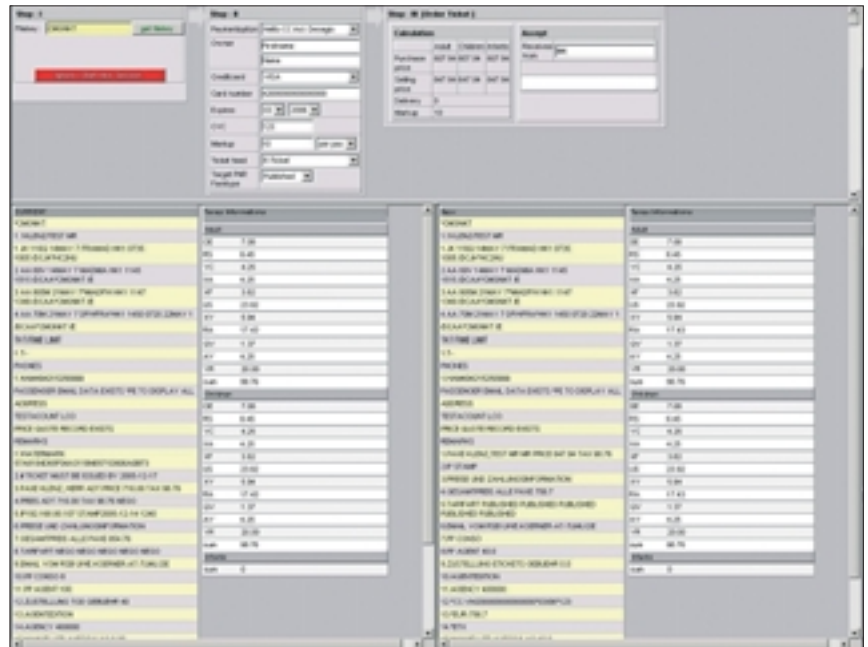

The PNR checker optimizes the ticketing process or integration into third party management information systems (MIS) or mid/back office systems.

It reduces the necessity of manual intervention almost completely.

The Price checker validates manually generated bookings as well as bookings that were generated through the booking engine and checks instantly if any other GDS loaded or net fares are applicable for the given booking. Bookings that are not yet ticketed can be rebooked in another booking class, at another price or fare type that initially was not available or applicable at the original time of booking.

The Price checker enables rebooking with other fare types (Published, Nego and Corporate Nego, Cat35 or Net fare).

New functions overview:

- New layout with multiple windows.
- Openjaws (single, double) and stopovers

My Office

- Overview of all bookings
- Cancellation of unticketed bookings
- Queue placement and direct transfer onto ticketing queue of bookings
- Print, email or fax booking confirmations.
- Calculation of mark-ups/mark-downs and service fees per carrier, routing, booking class, fare type, price or flight number.
